

*The Life cycle
of Salmon and
the River Moy*

By Dayna

Life cycle of Salmon

Salmon spawn their eggs in the river between December and January. The eggs are laid in clean gravel between March and April and turn into alevin. During the freshwater stage, the fry and turn into parr.

Life cycle of Salmon

Estuary stage parr turn to smolts and move to an estuary. Smolts leave the estuary and go to sea to feed and return to spawning rivers because they have to lay their eggs.
